

## RECRUITING AGENT CONTROL TOWER

### PROBLEM STATEMENT

Recruiting teams are beginning to use multiple AI agents for sourcing, screening, scheduling, candidate engagement and market intelligence alongside human recruiters. As the number of agents grows, the challenge shifts from creating another isolated recruiting bot to coordinating who or what performs each task, when work should be escalated and how results are monitored.

Develop a Recruiting Agent Control Tower that orchestrates human recruiters and multiple specialized AI agents across open requisitions. The platform should allocate work, coordinate multi-step workflows, monitor agent activity and deliver high-value exceptions or shortlisted candidates to human recruiters.

### CORE REQUIREMENTS

- Maintain a registry of human recruiters and AI agents with defined roles, permissions and capabilities.
- Prioritize open jobs based on urgency, workload, service-level targets or configurable business rules.
- Automatically assign sourcing, screening, outreach, scheduling and intelligence tasks to suitable agents.
- Coordinate multi-agent workflows and preserve context when work passes from one agent to another.
- Support human approval, override and exception handling at critical decision points.
- Track agent actions, outputs, failures, handoffs and completion status in an auditable timeline.
- Measure productivity and funnel metrics such as profiles discovered, verified, contacted, responded and shortlisted.
- Integrate with ATS/CRM and communication systems instead of requiring recruiters to replace their existing stack.

### EXAMPLE SCENARIO

For an urgent role, the system could assign a sourcing agent to discover profiles, a verification agent to validate them, an outreach agent to contact selected candidates and a scheduling agent to coordinate interviews. The human recruiter receives the strongest candidates and only the exceptions requiring judgment or relationship management.

### EXPECTED OUTCOME

A working dashboard should show open jobs, available human and AI resources, current assignments, workflow progress, exceptions, agent performance and recruiter handoffs, demonstrating a single operational control plane for AI-powered recruiting.
